

Aurora scheduler

This website helps UofM students plan their class schedules easily and conveniently before registration.

It takes in user input, which are the courses they want to take in a semester (currently not applicable for Summer terms). Then, using real-time data scrapped from Aurora, it shows all possible scheduling options for the user's registration (no class overlaps). It also recommends the best option with the fewest class days and minimal time gaps between classes.

The customization section allows the user to view schedules that accommodate their specific time preferences.

This website is still under development with more features and improvements to come.

Usage

- Enter the term and courses then click **Submit** (or press **Enter**).
- Select a time period (days and times) when classes should not be scheduled, then click **Customized**.
- Use the navigation buttons to browse through different schedule options (or press **←** and **→**).
- Click on a class in the table to view more information about it.
